The Syntactic Interpretation of Overt NPs in Embɔsi*
Yvon Pierre Ndongo Ibara

In this paper I analyze the binding relation of overt NPs in Embɔsi. It has been demonstrated that some of the binding theory principles namely Principle A fails to explain reflexives distribution because they can occur outside their governing category and accessible subject. Hence I claim that the principle A enters among many other issues concerning parametric variation postulates. Yet I also assert that reflexives are very particular in Embɔsi as they are [+Anaphor] and [+Pronominal].

Keywords: overt NP, binding theory, Embɔsi, parametric variation.

1. Introduction

Standard analyses on the syntactic typology of NPs classify them in the light of the features [± anaphor] and [± pronominal]. These binary features classify NPs in terms of overt and non overt ones.

In this connection, this paper discusses the syntactic distribution of the overt NPs in Embɔsi*. Its main objective is to extend the descriptive binding tradition (Chomsky 1981, 1986, Liliane Haegeman 1991, Lasnik and Uriagereka 1988, Black 1999, Radford 2004, Abney 1987) to a Bantu language in order to question the universality of binding theory principles. Put otherwise, this paper aims to check whether the dichotomy [± Anaphor] and [± pronominal] can efficiently and adequately account for data from world languages or fall into parametric variation issues.

To start with, overt NPs refer to visible lexical categories among which pronouns, and names. Let’s take (1) as the starting point:

(1) a. Ikià âdingâ wâ
    lit. Ikia he/she-love him/her
    i.e. Ikia loves him/her

b. Mwànà âkòsi wâmènë
    lit. Child he/she-hurt him/herself
    i.e. The child hurts him/herself

c. Ambòri bäsèrë’ bârè bá ádi ándzángå
    lit. Soldiers they-say that them they-be warriors
    i.e. Soldiers say that they are warriors

d. Ngala âbàârâ nàrè Kùmù âdi òyòò
    lit. Ngala she-think that Koumou he/she-be poor
    i.e. Ngala thinks that Koumou is poor

It appears that the above examples that there are three types of overt NPs:
(2) a. Lexical NP such as Ikìà, Mwànà, Ambòrì, Ngàlà, Koumou
    b. Pronouns such as wà, bá
    c. Reflexive pronoun such as wàmènè

The interpretation of these three types of NPs is not identical. On the other hand, their syntactic distribution within a sentence domain obeys restrictive conditions. For instance, lexical NPs do not need some other entities to capture their reference; they have inherent properties that enable them to select an independent referent. Yet, pronouns and reflexives lack inherent properties to select a given referent from the universe of discourse. They require an outer element from which they inherit their reference. At this point I advance that each type of NPs in (2) has its principles which offers an explanation for its different distributions and its references. In this respect, three principles have been developed in the literature namely:

(2) d.

• Principle A: It concerns anaphors and it claims that they must be bound in their governing categories (e.g. wàmènè);
• Principle B. It deals with pronouns and it assumes they pronouns must be free in their governing category (e.g. bá, wà); and
• Principle C: It covers R-expressions and it suggests that they must be free everywhere (e.g. Ikìà, Ngàlà, Kùmù)

In fact, Principle A can explain the following occurrences of reflexives and anaphors:

(3) a. Olómi yàmbá Ngàlà àkòsi wàmènè
    lit. husband of Ngala he-hurt himself
    i.e. Ngala’s husband hurt himself

b. Mwási yàmbá Kàngà àkòsi wàmènè
    lit. wife of Kanga she-hurt herself
    i.e. Kanga’s wife hurt herself

*c. Mwási yàmbá Kàngà àkòsi bàmènè
    lit. Wife of Kanga she-hurt themselves
    i.e. *Kanga’s wife hurt themselves

*d. Ngá ìkòsi nàmènè
    lit. Me I-hurt yourself
    i.e. *I hurt yourself

In (3 a-b), the reflexives pick up their references from the NP which is higher to them. Thus we assert that both the antecedent (the higher NP) and the reflexive are co referential by virtues of agreement. It emerges from (3) examples that all the nominal features, mainly the gender is not overt in Embòsì. As Embòsì lacks gender the male and female refer to the same
reflexive wàmènè. Yet the number feature rules out (3c) which is then ungrammatical. Similarly, the person feature renders (3d) odd or ungrammatical. An in-depth analysis of the relationship between a reflexive and its antecedent will lead to the consideration of the C-command criteria and locality constraints which are expressed through the Principle of Reflexive Interpretation (PRI): ‘A reflexive pronoun must be bound inside a clause that contains it and its governor.’

(4)  

a. Kàngá åtà nàrè wàmènè àdì obwè  
lit. Kanga he-see that himself he-be good  
i.e. Kanga thinks that himself is nice  

b. Isòngò åbààrà wàrè wàmènè àdì là iò'ngò  
lit. Issongo she-think that herself she-be with beauty  
i.e. Issongo thinks that herself is good looking  

c. Nò òbòmi ndzórò nòmènè  
lit. you you-kill body yourself  
i.e. You kill yourself  

d. Nò nàrà nòmènè ɔdzwà ɔbà mwàsi  
lit. you that yourself you-go marry wife  
i.e. You say that you are going to marry your wife yourself  

e. Ibara wàmènè àyàà  
lit. Ibara himself he-come  
i.e. Ibara is coming himself  

f. Wàmènè Ibara àyàà  
lit. himself Ibara he-come  

g. Wàmènè àyàà  
lit. himself he-come  

An examination of reflexives in (4a-b, 4d-g) shows that there is no clausemate antecedent to which they are bound although these sentences are grammatically correct in Embosi. Thus these sentences stand as a violation of the Complete Functional Complex (CFC) which reads as follows: ‘A reflexive must be bound in the minimal domain containing it, its governor and a subject.’

The domain of binding defined in terms of CFC is successful in other world languages such as English, but it is rather inadequate in Embosi because it cannot offer an explanation for the grammaticality of these examples. In order to accommodate examples such as (4a-b, 4d-g), we need to revisit the CFC and PRI principles. In (4a), Kanga fails to C-command the reflexive that is lower to it because of the Comp barrier as illustrated below.
As ‘Kanga’ does not C-command nor bind ‘himself’, how can one explain the grammaticality of (4a) and the like? This suggests that the domain of binding for reflexive is parameterised across languages because barriers for government are language specific. Ndongo Ibara (2007) argues that CPs are not too powerful to block government in Embosi. Consider furthermore that in (5), there are more than two CPs that intervene between the reflexive and its governor without yielding any deviancy.

(5)   Kàngà àbààrà wàrè ìbàà lídí ìbwè èdí wàmènè
lit. Kanga he-think that man who-be good it-be himself
i.e. Kanga thinks that the man who is good is himself

It appears that the distance of the binding domain is too large in Embosi. As a result, I reformulate the Principle of Reflexive Interpretation along the following lines: Extended Principle of Reflexive Interpretation (EPRI) which is read as: ‘A reflexive can either be bound inside and or outside its governor and accessible subject.’

This reformulation will account for the grammaticality of examples in (4). Yet some of the reflexives in (4) instance different distributions to the ones I have just dealt with. It results that the binder and these reflexive are too close so as they appear in the same constituent (4e-f); it is lower or even higher than its governor. Again (4g) shows a reflexive that lacks an overt NP hence its governor is not accessible. From (4e-g) examples, I assume that the different distributions of the reflexives are the consequences of Move α rule on one hand, and on the other they instance Embosi pro drop language features. I assert that the reflexive in (4e-f) originates from its underlying position in post verbal position and follows a cyclic movement. Basing upon the copy theory of movement, a copy of the reflexive that is preposed is left at the post verbal position as in:
Of interest is the fact that the reflexive merges onto the head of the null light nP because the NP is still visible in its initial position. This proposal has been put forward by (Radford 2004, Chomsky 2000, 2001). On the basis of this argument, it would be useful to suggest that in (6c) the lexical NP can be dropped at the S-structure to obtain a sentence such as (4g). In fact, since agreement is related to morphology (Bobaljik 2006) the reflexive Agr picks up the nominal features of the subject. As a matter of fact, Chomsky (1981) treats Agr as a Big subject. That is to say, in the absence its overt NP, the reflexive must pick up its reference from the clitic pronoun which is affixed to the verb prefix position. This last hypothesis rules out the following sentences.

*(7) a.   nòmènè àdingà wà
        lit. Yourself he/she-love him/her
b.  wàmènà ídingà nà  
lit.  him/herself I-love you

c.  bámènè lèdingà wà  
lit.  themselves we/you-love him/her

It would be possible, of course, to set up an ad hoc rule according to which the binding domain in Embòsi is a case of long distance binding where the subject can govern the reflexive from a lower tensed clause. In what follows, I am going to concentrate on the interpretation of anaphors.

(8)  

a.  Bá ápé ábià àbòndì  
lit.  They give each other gifts
i.e.  They give others gifts

b.  Okwéré àbààrà wàrè básí bátsénà là àbià  
lit.  Okwere he-think that wives they-Insult-Rec to others  
i.e.  Okwere thinks that wives call each other bad name

c.  Büyà àbàâra wàrè abià bátswá  
lit.  Buya he-think that others they-insult  
i.e.  Buya thinks that some insult

d.  Báñà ãyélina là àbià  
lit.  Children they-enjoy-Rec to others  
i.e.  Children enjoy one another

e.  àbwè bányánginà  
lit.  In-laws they greet-Rec  
i.e.  In-laws greet each other

f.  álómi bábaàrà bàrè là abìà ádinginà  
lit.  Husbands they-think that each other they-love-Rec  
i.e.  Husbands think that they love each other

g.  álómi ámbìgi  
lit.  Husbands they-love  
i.e.  Husbands love

h.  átáì bábaàrà bàrè bá bábwéénà là ábià ábángá  
lit.  fathers they-think that them they-throw-Rec  
i.e.  fathers think that they throw one another stones

As (8g) indicates, reciprocals require a plural antecedent. In Embòsi reciprocity (Rec) is signalled through morpheme incorporation. The reciprocal morpheme ‘n’ is incorporated into the predicate suffix position. In fact, Embòsi allows two possibilities as regards reciprocity: In (8e) the verb iyéłe is incorporated with the reciprocal morpheme ‘n’ whereas
elsewhere the predicate is either followed by là àbià phrase or it incorporates the reciprocal morpheme and selects the ‘là àbià phrase’.

One word of caution will be sounded here. The complement là àbià refers to reciprocal actions only if it occurs in the post verbal position, while elsewhere it is something different (9h). In (9a), bà and àbià cannot have the same referent by means of co-indexation. Furthermore, the insertion of là in front of the NP àbià cannot trigger reciprocal reading though the accessible subject NP bà is plural. The fact that là àbià cannot imply reciprocity is substantiated by the lack of an overt reciprocal morpheme. In this respect, là àbià can only refer to reciprocal actions once the following arrangements are met:

(i) It occurs in post verbal position, and (ii) the governor predicate must exhibit an overt reciprocal morpheme ‘n’.

A survey of a number of examples with reciprocals in (8) reveals that their interpretation is asymmetric to that of reflexives. It has been so far formulated that reflexives can be bound inside or outside the governing domain; yet, reciprocals are compelled to occur within their governing domain. As a matter of fact, I cannot argue in favour of uniformity of anaphors and reflexive interpretation; each of them should have a specific theorem. For, while reciprocals are bound within their governing category, reflexives are either bound or free from their governor. The following examples are concerned with pronouns.

(9)  a.   Íwandzá àbéà wà
    lit.   Iwandza he-call him/her
    i.e.   Iwandza calls her/him

b.   Ngâmbômi àbâàrà wàrè bôlà ôkôsi bwâmênè
    lit.   Ngambomi he-think that sister/brother she/he-hurt her/himself
    i.e.   Ngambomi thinks that her sister hurts herself

c.   Ngâkàlà àta nàrè wà âdí èmbóló ènê
    lit.   Ngakala he-see that he-be hunter big
    i.e.   Ngakala thinks that he is a great hunter

d.   Ngyèkyêni àbényà ôbé à wà/wâmênè
    lit.   Ngyekyeni he-accept bad of him/himself
    i.e.   Ngyekyeni accepts his own fault

e.   Okólà àtônà wàrè Ngâkôsô àßinà wà
    lit.   Okola he-refuse that Ngakosso he-hate him
    i.e.   Okola denies that Ngakoso hates him

f.   Wà àtôní ngá
    lit.   him/her he/she-refuse me
    i.e.   He/she dislikes me

68
g. Ibàrà àdzé wà là bòlà
   lit. Ibara he-ate him with sister
   i.e. Ibara ate with his sister

h. Elèngà àdzá wà èkò ngá ìdzá swé
   lit. Elenga he-eat him cassava me I-eat fish
   i.e. Elenga is going to eat cassava while I will eat fish

i. Ikàmà às ìrì wàrè Ikíà àtìyàà wà àdí ìψóà
   lit. Ikama she-said that Ikia she-told that her she-be crazy
   i.e. Ikama said that Ikia told that she is crazy

It turns out from (9) that the syntactic distribution of pronouns is parallel to that of reciprocals and reflexives. It appears that a pronoun is totally independent and free in its governing domain. The only possibility that instances a case of pronoun binding in its governing category is that of coordination of NPs in (9g). In (9i) the occurrence of wà demonstrates that the foregoing explanation does not tally, hence it is important to work it out. As such, a pronoun can be bound in its governing category in case of coordination in Embòsi.

From (10) below, it will surface that R-expressions do not need antecedent, they are free everywhere by virtue of their intrinsic properties.

(10) a. Adùà àbèri wà
   lit. Adùà he-beat him/her
   i.e. Adua beat him/her

b. Okàndzé àsìrè wàrè wà àfòdzá
   lit. Okandzé he-say that him he-Asp-eat
   i.e. Okandzé says that he is about to eat

c. Wà àsìrè wàrè Obàndzà àdí bò
   lit. Him/her he/she-say that Obandza he-be sleeping
   i.e. He/she said that Obandza is asleep

Works within the binding theory have formalized the following chart as a summary of overt NPs features (Chomsky 1982:78, Haegeman 1991:322).

(11)

<table>
<thead>
<tr>
<th>Type</th>
<th>Overt NPs</th>
</tr>
</thead>
<tbody>
<tr>
<td>+Anaphor,</td>
<td>- Pronominal</td>
</tr>
<tr>
<td>-Anaphor,</td>
<td>+ Pronominal</td>
</tr>
<tr>
<td>- Anaphor,</td>
<td>- Pronominal</td>
</tr>
<tr>
<td>+Anaphor,</td>
<td>+Pronominal</td>
</tr>
</tbody>
</table>

A close attention of the above analysis of Embòsi NP-types stands as an objection to consider that chart adequate device for the interpretation of its overt NPs. The chief objection
concerns anaphors. In fact, it is due to their common features (+Anaphor, -Pronominal) that reflexive and reciprocal have been classified into the same group in keeping with data from Indo-European languages. The overt NPs that are referred to as ‘anaphors’ do not qualify for being treating alike hence paired together in Embosi. If I try to puzzle out this matter, it is clear that reflexives and reciprocals are not subject to the same rule of interpretation. In this perspective, I suggest to consider Principle A as a parametric variation issues as word order and the like. I wonder whether it would be better to separate reflexives from reciprocals so as to attain explanatory adequacy in Embosi. Structurally, the refinement of the Principle A would clearly show the difference between them in accordance with the features that typify both types of NPs in the language under discussion.

<table>
<thead>
<tr>
<th>(12) NP Types</th>
<th>Features</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reciprocals</td>
<td>+Anaphor, -Pronominal</td>
</tr>
<tr>
<td>Reflexives</td>
<td>+Anaphor +Pronominal</td>
</tr>
</tbody>
</table>

It should be reminded that the three principles presented in (2) so far have been formalized in terms of the chart in (11). However, (12) is strict objection. It would not be necessary to set up another principle which admits the separation of reflexives from reciprocal because they share one identical feature although one aspect makes them different. As a result, the feature [+pronominal] of reflexives is an illustration of idiosyncratic features of Embosi. So I suggest that the following meets the syntactic features and distributions of overt NPs in Embosi.

<table>
<thead>
<tr>
<th>(13) Type</th>
<th>Overt NPs</th>
</tr>
</thead>
<tbody>
<tr>
<td>+Anaphor, -Pronominal</td>
<td>Anaphors</td>
</tr>
<tr>
<td>-Anaphor, +Pronominal</td>
<td>Pronouns</td>
</tr>
<tr>
<td>-Anaphor, -Pronominal</td>
<td>R-expressions</td>
</tr>
<tr>
<td>+Anaphor, +Pronominal</td>
<td>Reflexives</td>
</tr>
</tbody>
</table>

2. Conclusion

To summarize, Embosi is a particular language in which classical linguistic standards can be furthered and extended. In such a language, to maintain a syntactically oriented approach to anaphors and pronominals is to admit that some of the binding well known principles fall into cross linguistic parametric issues. As a matter of fact, Embosi shows that reflexives share both anaphors and pronominals features.
Notes

* I am particularly grateful to Mr Jean Pierre Nkara for his comments on the earlier draft of this paper

1 Embosi is one of the Bantu languages spoken in the northern part of the Republic of Congo particularly in the regions of La Cuvette and a part of Les Plateaux. See Théophile Obenga (1976) where Embosi is grouped with other speech forms namely Akwa, koyo, Mboko, and Ngare.

2 Embosi relative pronoun ‘that’ varies according to its referring subject (see Ndongo Ibara 2007) for details. Cf. e.g. 1 (c-d); 4 (a-b); 8 (b-c,f,h) etc. Here are some more examples:

   ngá i-báàrà ngárè èdí òbé
   lit. me I think that it-be bad
   i.e. I think that it is bad

   nò ò-báàrà nàrè èdí òbé
   lit. you you think that it-be bad
   i.e. You think that it is bad

   wà à-báàrà wàrè èdí òbé
   lit. him/her he/she think that it-be bad
   i.e. He/she thinks that it is bad

   bíní lè-báàrà bárè èdí òbé
   lit. you you-think that it-be bad
   i.e. You think that it is bad.

3 Embosi clitic pronouns generally bear low tone. And as a pro drop language, Embosi realises the null subject parameter. Examples above show that Embosi makes the difference between the second pronoun singular and plural.

   i- yàà wó imbyëngì
   lit. I come there tomorrow
   i.e. I shall be there tomorrow
